**DETAILED ACTION**

***Election/Restrictions***

1. Applicant's election with traverse of claims 1-6 in the reply filed on 15 July 2004 is acknowledged. The traversal is on the ground(s) that a search of claims 1-6 encompasses claims 7-16. This is not found persuasive because Claims 1-6 are drawn to a signal processing circuit with phase difference control, Claims 7-14 and 16 are drawn to a shuffler type audio processing circuit, and claim 15 is drawn to a FIR and IIR filter.

The requirement is still deemed proper and is therefore made FINAL.

***Claim Rejections - 35 USC § 102***

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

3. Claims 1-6 are rejected under 35 U.S.C. 102(e) as being anticipated by Schott (US Patent 5,892,831).

Regarding Claims 1, 3, and 5, Schott discloses a method and an audio signal processing circuit for an audio reproduction apparatus at least having sound source located substantially at left and right sides to a listener, comprising: a phase difference

control portion which receives a left channel signal (Fig. 2, Lin) for the left sound source and a right channel signal (Rin) for the right sound source, controls a phase difference between the left and right channel (Phase Shifter) signals so as to produce a relative phase difference in the range of 140 degrees to 160 degrees (Figure 3 discloses a phase difference between C and D in a range of 140 to 160 degrees at a frequency of 400Hz), and outputs the phase difference controlled left and right channel signals for the left and right sound source, respectively (Fig. 2, outputs Lout and Rout).

Regarding Claims 2 and 5, Schott further discloses an audio signal processing circuit according to claim1 and 3 wherein the phase difference control portion produces the relative phase difference of 140 degrees to 160 degrees in a frequency region ranging from 200 Hz to 1 kHz (Fig 3 discloses a phase difference between C and D in a range of 140 to 160 degrees at a frequency of 400Hz).

Regarding Claim 4, Schott further discloses the left and right surround sound sources enhance a stereo image (Col. 1, lines 14-16) (i.e. virtual sound sources) produced by a sound image localization processing (Figure 2).
